國立臺灣大學 112 學年度碩士班招生考試試題

題號： 326
共 6 頁之第 1 頁

1. (15%) Suppose you are taking a multiple-choice test with c choices for each question. In answering a question on this test, the probability that you know the answer is p. If you don't know the answer, you choose one at random. What is the probability that you knew the answer to a question, given that you answered it correctly?

2. (20%) Compute the median for the exponential distribution with parameter $\lambda$.

3. (15%) The average IQ in a population is 100 with standard deviation 15 (by definition, IQ is normalized so this is the case). What is the probability that a randomly selected group of 100 people has an average IQ above 115?

4. (8%) A leading company in the financial sector in Taiwan intends to redesign its service process for improving customer engagement and loyalty. If they assume that at least 75% of their target audience will prefer their new, innovative service process over the existing one, and the margin of error is given as 0.05, what sample size they need to verify their prediction with a 95% confident level?

5. A car maker just launches a newly-invented engine. They want to prove that their newly-invented engine really improves the fuel efficiency. The following data are the performance (consumed liters per 100 kilometers) of two engines (the original one vs. the new one).

| Original | 13 | 10 | 13 | 12 | 14 | 14 | 13 | 10 | 11 | 11 |
|----------|----|----|----|----|----|----|----|----|----|----|
| New      | 11 | 8  | 8  | 9  | 12 | 11 | 10 | 9  | 9  | 8  |

   A. (8%) Assuming the engine performance are measured independently (20 different cars), please conduct a hypothesis test here and conclude your result ($\alpha = 0.05$).

   B. (8%) Assuming the engine performance are gathered from paired samples (10 cars), please conduct a hypothesis test here and conclude your result ($\alpha = 0.05$).

6. The average purchase amount per customer in an outlet mall in Linkou is $4,500 NTD according to a survey by a journalist. An outfit brand manager who has

business in that outlet mall intended to confirm this information. She investigated the total purchase amount from 20 customers. The sample average is \$4,200 NTD, with a standard deviation of \$1,000 NTD. She found that the result of a hypothesis test here ($\alpha = 0.05$) suggested that the average purchase amount of current sample set was not significantly different from \$4,500.

    A.    (8%) If the true average purchase amount is \$4,000, what is the probability of Type 2 error here?

    B.    (8%) Given that the probability of committing a Type 2 error is set at 0.2 here, how many samples is required?

7.  (10%) The following is a table showing information about the year-end bonus of 100 employees within a company. Each person in this dataset is categorized in terms of his or her received bonus (using each person's monthly salary as a calculation basis) and job level. Does the dataset suggest that the job level and year-end bonus are related here? Please analyze this question with an appropriate hypothesis testing method ($\alpha = 0.05$).

| | | Job Level | | |
|---|---|---|---|---|
| | | Entry level | Mid-Level | Senior |
| Bonus (as # of | 1.5 | 33 | 5 | 2 |
| month of monthly | 2.5 | 10 | 20 | 8 |
| salary) | 3 | 7 | 5 | 10 |
